

impero education pro

Full Name Override for ChromeOS

Impero Education Pro 2019

EXTERNAL

Introduction

Currently Impero Education Pro only pulls the email address for logged in users on the ChromeOS platform. This can make identifying a user or users difficult. To alleviate this problem, we have added the ability to create a “FullNames.csv” that will provide the Full Name of the user directly into the Impero Cloud

The following guide explains how to create a “FullNames.csv” file

CSV File

A CSV file is needed to perform the override of full names and this must be created manually. Please find below the required name for the CSV file and its default location

File name - FullNames.csv

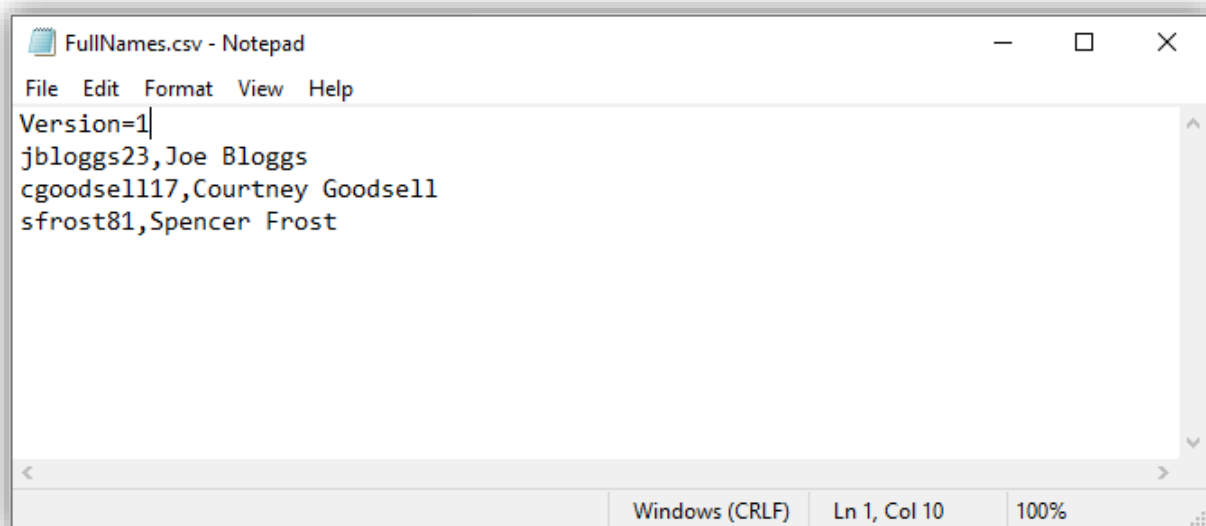

Location - C:\Program Files (x86)\Impero Solutions Ltd\Impero Server\Data

(the location above is the default install location of Impero Server. If you have installed Impero Server to a different location then the CSV file must be placed in the data directory at that location)

The 1st line of the CSV file must contain the following of the file won't read

Version=1

The CSV file then needs to contain two values. The first is the username that the users logs into the device with and the second is the Full Name that you want Impero to display

```
FullNames.csv - Notepad
File Edit Format View Help
Version=1
jbloggs23,Joe Bloggs
cgoodsell17,Courtney Goodsell
sfrost81,Spencer Frost
Windows (CRLF) Ln 1, Col 10 100%
```

In the example above *jbloggs23*, *cgoodsell17*, and *sfrost81* are usernames that students are using to login to devices. Joe Bloggs, Courtney Goodsell and Spencer Frost are the full names that will be displayed in Impero when these users are logged in.
